

# Grow a garden with air plants

Want to have a garden but don't have any soil or outside space? Then air plants may be just what you are looking for.

Air plants are also known as Tillandsias.

- They don't grow by putting roots down into soil, instead they use their roots to attach themselves to things like pebbles, rocks, sticks or wood.
- Air plants are just like other plants. They need air, light and water to survive. In fact, they thrive with several hours of bright, indirect light each day.
- Air plants get the nutrition they need by absorbing water through their leaves. Generally they need watering once a week.
- To obtain air plants, you will need to visit your local garden centre and ask if these plants are available. A garden specialist can assist you with your purchase and tell you how to care for your plant.

For inspiration, check out the pictures below to see the various ways you can make a home for an air plant.
